

# Assignment 3 – Resolution of a Complex Professional Problem Issue (Individual)

## Scenario: UrbanMove

**Company:** UrbanMove

**Location:** Brisbane, Australia

**Industry:** Smart Mobility & Transport Technology

---

## Scenario:

UrbanMove is an Australian technology company that provides a smart mobility platform used by city councils to manage public transport, traffic flows, and shared mobility services such as e-scooters, bike-sharing, and on-demand shuttles.

The platform brings together data from multiple sources, including public transport systems, GPS data from vehicles, third-party mobility providers, and mobile applications used by commuters.

UrbanMove has recently secured a contract with several Queensland local councils to deliver a unified “Mobility-as-a-Service” platform. The system is intended to support real-time journey planning, integrated ticketing, and data-driven insights to assist with transport planning and congestion management.

The rollout has now been underway for some time, and a number of issues have started to emerge.

There have been **inconsistencies in how the system behaves across different councils**, particularly where local systems and third-party services are involved. Some features appear to work well in certain locations but not in others. There has also been a **growing number of defects and change requests**, with many relating to data accuracy and user experience.

There appears to be **some uncertainty around integration requirements**, particularly in relation to third-party providers. Different stakeholders do not always share the same understanding of responsibilities, service levels, or expected system behaviour.

Recently, a **minor cybersecurity incident** was identified, where an external party was able to access non-sensitive system data through a third-party integration, including "de-identified" trip patterns that, when cross-referenced with public data, could potentially identify specific individuals. While the issue was addressed, it has raised concerns among councils and partners about the overall security of the platform.

Some stakeholders have also raised questions about **how user travel data is being collected and used**, particularly in relation to privacy and transparency.

A number of changes have taken place within UrbanMove during this period:

- A shift towards a more platform-based architecture integrating multiple external services
- The adoption of Agile delivery practices, with multiple teams working in parallel
- Rapid expansion of teams, including the use of contractors and offshore developers

There have been mixed views across the project. Some of the councils are raising concerns about reputational risk and how the recent security incident might affect public trust. Internally, UrbanMove leadership is still under pressure to meet delivery deadlines and contractual obligations. Meanwhile, a couple of third-party providers are expressing frustration about shifting integration requirements and what they see as a lack of clarity around responsibilities. One of the third-party providers is a global giant based in Silicon Valley that refuses to change its API, while another is a small local Brisbane bike-share startup that is struggling to keep up with the technical requirements.

Communication across teams and partner organisations does not always appear to be consistent. In some cases, changes to the system are not well communicated, and different groups appear to be working with different assumptions about priorities and expected outcomes.

Senior management has asked you to review the situation.
